: Approximate computation of the distribution of dust precipitated out

from a horizontal jet of air

Periodical

: Zhur. tekh. fiz., 24, 1041-1048, Jun. 1954

Abstract

: Remarks that the distribution of dust precipated out onto a horizontal plane from free jets of air is of theoretical and practical value; e.g. in heat engineering, ventilation, dusting of plants in agriculture, etc. Presents an approximate method for calcutating the precipitation of dust from free air. Four references, USSR (D. N. Lyakhovskiy, M. A. Velikanov, G. N. Abramovich, S. A. Kharin).

"Effect of the Notch on Strength of Steel at Elevated Temperatures,"
M. I. Kurmanov, R. S. Kaplan, Kharkov Turbogenerator Plant imeni S. M. Kirev.

"Zavod Lab" Vol XVI, No 8, pp 975-979

Describes experiments for studying behavior of 2 steels, 40 KhN and EI 10, under continuous load at 500 and 550° and effect of the notch on their strength. Composition of steels is: 40 KhN = 0.41% C, 0.18% Si, 0.80% Mn, 0.65% Ni, 1.33% Cr; EI 10 = 0.31% C, 0.23% Si, 0.48% Mn, 1.17% Ni, 0.35% Mo, 0.15% V.

TITLE: The High-temperature Strength of Steel 1Kh13 (Prochnost' stali

1Kh13 pri povyshennykh temperaturakh)

PERIODICAL: Tr. Khar'kovsk. politekhn. in-ta, 1957, Vol 11, pp 45-53

ABSTRACT: A study was made of two heats of steel lKhl3 and one heat of steel 2Khl3 after both had been normally heat-treated. The ob, os, 6, w, and a values were determined at temper-

atures ranging from 20 to 550°C, and the influence of the deformation rate on changes in the mechanical properties was investigated. It was found that steels 1Kh13 and 2Kh13 are not sensitive to tempering brittleness. Within the 300-350° temperature range a determination was made of the long-term rupture strength over periods of 1,000-100,000 hours, of the creep limit over periods of 10,000 and 100,000 hours, and of the stresses producing a large set of the long-term rupture strength

ducing a 1 percent deformation. The long-term rupture strength for a > 6,000-100,000 hour life was obtained by extrapolation

Card 1/2 from the long-term strength curves. To investigate the stability

137-58-2-4164

The High-temperature Strength of Steel 1Kh13

of the structure and properties, the mechanical properties of the steels were determined at room temperature after a prolonged heating (up to 5,000 hours) at 470 and 530°, with subsequent cooling in air. Steel 1Kh13 was found to have stable properties when heated for long periods (up to 5,000 hours) at temperatures up to 550°. When stressed for long periods at these same temperatures it exhibited eminently plastic properties. Its strength was not impaired by notching; the long-term strength of the notched bars exceeded by 50 percent that of the smooth bars.

Structural Changes in the Steel 20KhM-L After Holding for a Long Time at Elevated Temperatures (Strukturnyye izmeneniya TITLE: v stali 20KhM-L pri dlitel'nykh teplovykh vyderzhkakh)

PERIODICAL: Fizika metallov i metallovedeniye, 1958, Vol 6, Nr 6, pp 1122-1129 (USSR)

ABSTRACT: The stability of the structure of the steel 20KhM-L at elevated temperatures was investigated and the influence was elucidated of the applied stresses on structural changes. Specimens of this steel were investigated after normalisation annealing for 3 hours at 650 - 680°C (initial state) and after holding them for various durations in the loaded and no-load state at various temperatures. The composition of this steel was as follows: C 0.15%, Si 0.30%, Mn 0.61%, S 0.026%, P 0.039%, Cr 0.5% and Mo 0.55%. The mechanical characteristics of the specimens after holding them at various temperatures between 530 and 550°C for durations up to 5400 hours are entered in Table 2. The investigations included

Card 1/3

SOV/126-6-6-23/25 Structural Changes in the Steel 20KhM-L After Holding for a Long Time at Elevated Temperatures

metallographic, X-ray and electron-microscopic studies. It was established that carbide particles appear in the ferrite grains only after tempering in the temperature range 650 -680°C but not at lower temperatures. Changes in the tempering temperature are accompanied by insignificant changes in the lattice parameter of the  $\alpha$ -phase (2.8624 kX after tempering at 570°C and 2.8615 after tempering at 650°C). It was established from X-ray diffraction patterns that after normalisation annealing and tempering at 650 to 680°C for 3 hours, a mixture of 3 carbides can be detected in the carbide precipitate with the structure: Cr23C6, Mo2C and Fe2Mo2C. In the case of long-duration holding at 500 - 550°C, a coalescence of carbides takes place as a result of which carbide-free zones form at the boundaries of pearlitic grains. Coalescence leads to a growth of carbides of the structure Cr23C6 the dissolution of Mo carbides which can be explained by the low stability of the latter caused by the fact that they have a higher degree of dispersion than carbides of the type Card 2/3

SOV/126-6-6-23/25 Structural Changes in the Steel 20KhM-L After Holding for a Long Time at Elevated Temperatures

 ${\rm Cr}_{23}{\rm C}_6$ . Stresses which are near to the yield point of the steel lead to an acceleration of the process of coalescence by one order of magnitude at 530°C and by two orders of magnitude at 550°C. Due to the dissolution of Mo carbides, the  $\alpha$ -phase becomes enriched with alloying elements and this should have a favourable influence on the high-temperature characteristics of components made of this steel. There are 3 tables, 5 figures and 16 references, of which 12 are Soviet, 2 French, 1 German and 1 English.

TITLE:

To the Theory of the Acceleration of Charged Particles Due to a Turbulent Magnetic Field (K teorii uskoreniya zaryazhennykh chastits turbulentnymi magnitnymi polyami)

PERIODICAL: Tsirkulyar. Astron. observ. L'vovsk. un-ta, 1953, Nr 27, pp 1-10

ABSTRACT:

Development of a theory for the acceleration of charged particles due to inductive electrical fields which arise during magnetogasdynamic motions. Various cases of the interaction between the charged particles and such fields are examined. A kinetic equation is set up for determining the spectrum of high-speed charged particles, and methods for its solution are indicated.

Gases, Interstellar

Turbulent character of the motion of interstellar gaseous clouds. Dokl. AN SSUR 89, No. 4, 1953. Livov State U im. Franko, pp 643-46.

To confirm that motion of interstellar gaseous clouds is of a turbulent nature, the authors investigate radial velocities, using catalogue of V. S. Adams (Ap.J. 109, 1949). Conclude that motion of interstellar gaseous clouds obeys, in the first approximation, laws of isotropic and local turbulence. Presented by Acad G. A. Shayn 6 Feb 53.

Ionisation functions of the elements C I, Ma I, K I, Ca I, Ca II in interstellar space. Astron.tsir. no.137:6-7 Ap 153. (MLRA 6:8)

1. L'vovskaya astronomicheskaya observatoriya. (Gases, Interstellar)

Kaplan, S. A. Spectral theory of gas-magnetic isotropic turbulence. 2. Eksper. Teoret. Fiz. 27, 699-707 (1954). 1 - F/N The aim of the paper under review has been to present certain solutions of the equations governing the energy distribution in the spectrum of an (isotropic) hydromagnetic turbulence; the equations themselves having been previously discussed by the author [Dokl. Akad. Nauk SSSR (N.S.) 94, 33-36 (1954); MR 15, 1001]. In the case of a stationary solution, the spectrum of the kinetic as well as magnetic energy is continuous, and its slope is characterized by an exponent a in the law  $F(k) \sim k^{-\epsilon} (k = 2\pi/l, l)$  being the size of a turbulent element) in the neighbourheod of 1.6, depending but slightly on the scale of the flow, velocity of sound, dissipation of energy through shock waves, etc.). If  $\lambda > r$  ( $\lambda = c^2/4\pi\sigma$ ,  $\sigma$  being the coefficient of electrical conductivity, and r the viscosity coefficient), a second solution may apply, in which the exponent  $\alpha$  in the spectrum of the kinetic energy is in the neighbourhood of 5/3, and in the spectrum of the magnetic energy,  $\alpha \sim -1/3$ . In the last part of the paper, the author applies his spectral theory to study of nonstationary turbulence. Z. Kopal. 

Raplan, S. A. Isothermal flow of a gas in interstellar pace. Discontinuities if density and velocity. Astr. 2, 31, 31-35 (1934). (Russian)

The author's aim is to analyze the distribution of velocity and density in plane gas flows which may arise in interstellar space. In the first part of the paper under review the equations of one-dimensional gas flow are set up, and approximate solutions obtained in the form of series expansions in ascending powers of the parameter  $w = \log (\rho/p_0)$ , where  $\rho$  denotes the instantaneous density at any point of the actual gas flow, and  $\rho$  the density of the undisturbed medium. In the second part of his paper, the author considers the possibility of the formation of plane thocks in such a flow, and determines the corresponding density and velocity jumps across the shock front.

Title

: Possible Explanation of the Structure of Pibrcus Nebulae

Periodical: Astron. zhur., v. 31-4, 358-359, J1-Ag 1954

Abstract

: Fibrous structure is a characteristic property of interstellar nebulae and directly results from the fundamental laws of motion of the interstellar media. Two explanations are discussed: of J. H. Oort-shock waves and of Shayn and Gaze-electromagnetism. Difficulties are surmounted by combining both; filament formation is the result of the velocity parameter determining the jump in thickening of density in an electromagnetic field.

Abstract

: The author analyzes the theory of the acceleration of charged particles by an isotropic gas-magnetic turbulence. He obtains the kinetic equation for the determination of the spectrum of fast particles, and gives a method for its solution for various cases (stationary and nonstationary spectrum, the taking into account of magnetic braking losses, etc.). In the present work the author makes extensive use of the methods in the theory of shower process in cosmic rays. Twelve references: e.g. S. A. Kaplin [sic], Tsirk. Astapovich, Igor' Stanislavovich, and Kaplan, Samuil Aronovich

Vizual'nyye nablyudeniya iskusstvennykh sputnikov Zemli (Visual Observation of Artificial Earth Satellites) Moscow, Gostekhizdat, 1957, 81 p. 10,000 copies printed.

Ed.:

Rakhlin, I. Ye.; Tech. Ed.: Murashova, N. Ya.

PURPOSE:

This book is written to present information on artificial earth satellites, restricted to problems of visual and optical observation for which only the form, dimensions, and reflecting power of the satellite need be known. For technical problems - carrier rockets, orbits, equipment, etc. - the reader is referred to existing literature.

Card 1/8

Visual Observation of Artificial Earth Satellites (Cont.)

339

COVERAGE: The book gives basic information on the motions of artificial earth satellites, on the conditions of their visibility, and on methods of visual observation of satellites. The methods discussed in the book permit an approximate determination of the satellite orbit, calculation of the instant of passage of the satellite above given geographic points, and evaluation of the conditions for the observations. The last chapter deals with the problem of organizing and equipping stations for visual observation of satellites; the methods used for such observations are described and some suggestions are made on how to utilize such stations also for investigation of "telemeteors". The book contains 2 tables and 17 figures, whose legends are translated in order to indicate more fully the scope of the book. The authors express gratitude for valuable advice to A. M. Lozinskiy.

TITLE:

Shock waves in interstellar space. II: Ionisation

discontinuities. (Udarnye volny v mezhzvezdnom prostranstve. II. Ionizatsionnye razryvy).

PERIODICAL: "Astronomicheskiy Zhurnal" (Journal of Astronomy),

1957, Vol.34, No.2, pp. 183 - 192 (USSR).

ABSTRACT:

As was shown by Stromgren (1), the transition zone between areas of ionised (HII) and unionised (HI) hydrogen in interstellar space is relatively narrow (its thickness is of the order of  $1/n_1k_1 \approx 1.6 \text{ x}$ 

x 10<sup>17</sup>/n<sub>1</sub> cm where n<sub>1</sub> is the number of neutral atoms of hydrogen in a unit volume, and k<sub>1</sub> the coefficient of absorption from the first level). The temperature in HII areas is of the order of 1000° while in HI areas it is less than 1000° and probably near 100°. It follows that the transition zone between HII and HI areas can be at rest relative to the gas only if the pressures on either side of it are equal, i.e. densities are inversely proportional to the temperature. This condition often does not hold, and as a result, gas flows through this transition In such a case an ionization discontinuity appears, and moves relative to the interstellar gas. In this work, the results of investigations (carried

APPROVED FOR RELEASE: 06/13/2000 CIA-RDP86-00513R000520430012-4"

4

Shock waves in interstellar space. II: Ionisation discontinuities. (Cont.)

out in the period 1954-1955) into the motion of such ionisation discontinuities, are reported. Similar work has already been reported in refs. 2, 3, 4. In order to derive relations which determine the change in gas parameters when the gas flows through the ionisation discontinuity, the usual concepts of constant mass transport and constant momentum transport are employed over control boundaries on both sides of the discontinuity. It is shown that

 $v_1 = \left[\sqrt{2RT_2} + \frac{1}{2} \frac{hv_0}{cm_H}\right] + \left[\sqrt{2RT_2} + \frac{1}{2} \frac{hv_0}{cm_H}\right]^2 - RT_1$ 

where  $v_1$  is the perpendicular component of gas velocity relative to ionisation front, hy - ionisation energy, R - the gas constant, T - temperature. Postscripts 1 and 2 refer to HI and HII respectively; my is the mass of a hydrogen atom. The positive sign corresponds to an ionisation discontinuity of condensation. Often  $T_2 \gg T_1$ , hence in the latter case:

APPROVED FOR RELEASE: 06/13/2000 CIA-RDP86-00513R000520430012-4"

Shock waves in interstellar space. II: Ionisation discontinuities. (Cont.)

$$v_{1} \approx 2\sqrt{2RT_{2}} \left(1 - \frac{T_{1}}{RT_{2}}\right) + \frac{hv_{3}}{cn_{H}} \approx 2\sqrt{2RT_{2}}$$

$$v_{2} \approx 2v_{1}, v_{1} \approx \frac{m_{H}c_{H}N}{2\sqrt{2RT_{2}}}$$

In the other case (negative sign) 
$$\mathbf{v}_1 \approx \sqrt{2RT_2} \quad \frac{\mathbf{T}_1}{4T_2} \quad , \quad \mathbf{S}_2 \approx \mathbf{S}_1 \quad \frac{\mathbf{T}_1}{4T_2} \quad .$$

If, until the passage of the ionisation front, the gas is stationary, then v, is equal to the velocity of the front. These expressions lead to values of density (§) which do not correspond to actual conditions. It follows that the formation of an ionisation front should be connected with the simultaneous appearance of either a rarefaction wave or a shock wave. appears that the most realistic wave system in interstellar space is the combination: shock wave of condensation - ionisation wave of rarefaction. following problem is, therefore, considered. A shock wave is propagated in a quiescent unionised hydrogen  $(\P_0, T_0)$ , which compresses the gas to a density  $\P_1$ ,

APPROVED FOR RELEASE: 06/13/2000 CIA-RDP86-00513R000520430012-4"

500

Shock waves in interstellar space. II: Ionisation discontinuities. (Cont.)

and increases its temperature to T<sub>1</sub>. After this follows a region of compressed isothermal hydrogen, in which an ionisation front of rarefaction (density of gas in front of the ionisation front = ¶<sub>1</sub> and is, in general, different from ¶<sub>1</sub>. The problem may be solved relatively simply if the motion is determined by only two parameters which assume independent values (7, 8). In the present case such parameters are the density of the gas ¶<sub>2</sub> and its temperature T<sub>2</sub> (alternatively: ¶ and T may be used as the parameters). Eqs.(13) are the differential equations corresponding to the symmetrical isothermic gas flow (N = 1, 2, 3, for plane, cylindrical and spherically symmetrical flow respectively), assuming that the measure of the emission of the region HII remains constant (M = constant). It follows that both the ionisation front and the shock wave are propagated with constant velocities where

$$v_1 = \eta_1 \sqrt{RT_2}$$
 and  $v_s = \eta_s \sqrt{RT_2}$ 

where  $\eta$  is a dimensionless parameter given by

$$\eta = -\frac{r}{t\sqrt{RT_2}}$$

Shock waves in interstellar space. II: Ionisation discontinuities. (Cont.)

Two special cases are then taken up.
(a)  $T_2 > T_1 > T_0$ : This regime of flow is only possible if  $S_2 < 2 S_0$  (otherwise  $V_1 > V_8$ ). Secondly, the compressed region of unionised hydrogen is very thin and dense, and therefore, probably unstable (with  $T_1 \sim 100^\circ$  and  $T_2 \sim 10^\circ$  000° the relative thickness of this layer is  $\sim (800)^{-1}$  and  $S_0 \sim 400 S_0$ ). Thirdly, its temperature would quickly fall to  $S_0 \sim (800)^\circ$  This regime is possible only if  $S_0 < S_2 < 2 S_0$ . Here the thickness of the unionised compressed layer is of the order of the linear dimensions of the whole moving region. However, in this case the gas will be luminescent and its temperature  $S_1 \sim 1000$ 

The real state of affairs falls somewhere between the last two cases, but is nearer to (a) provided  $T_1 \gg T_0$ 

and  $c_0 > c_2 = 2 \times 10^{-25} \text{ M g/cm}^3$ .

APPROVED FOR RELEASE: 06/13/2000 CIA-RDP86-00513R000520430012-4"

THE SECOND OF THE PROPERTY OF

The general picture of the motion of ionised discontinuities is shown to be as follows (assuming  $T_1 \sim 1000^\circ$ ,  $T_0 \sim 1000^\circ$ ,  $T_0 \sim 5_2$   $T_0 \sim 2 \times 10^{-25} M g/cm^3$ ,

M = constant). A shock wave of condensation (compression) with luminescence moves with a velocity

 $v_s = 2\sqrt{RT_2} (\frac{9}{2}/\frac{9}{0}) \sim 18$  km/sec. The density in it is increased by a factor 40. It is followed by a narrow (1/80) region of compressed unionised hydrogen which moves with a constant speed

 $v = 2\sqrt{RT_2}$   $\frac{9}{2}$   $\frac{9}{9}$   $\frac{9}{9}$   $\frac{18}{9}$  km/sec and constant density  $\frac{9}{9}$   $\frac{9}{9}$  This, in turn, is followed by an ionisation wave of rarefaction with a speed of 0.3 km/sec. (relative to observer this speed is nearly 18 km/sec) in which the hydrogen is ionised and its density falls by a factor of 40. Next, a region of ionised hydrogen follows with a speed  $v \sim (\frac{r}{t} - \sqrt{2RT_2}) \sim \frac{r}{t} = 13$  km/sec and the density falls from the value  $\frac{9}{2}$  to 0.44  $\frac{9}{2}$ . Finally, by  $r \leq t\sqrt{2RT_2} = (13 \text{ km/sec})t$ , the ionised hydrogen is stationary and has a constant density (= 0.44  $\frac{9}{2}$ ). 8 references, 3 of which are Russian.

Conference on the physics and the origin of planetary nebulae. (Saveshchaniye po fizike i proiskhozhdeniyu

planetarnykh tumannostey).

PERIODICAL: "Astronomicheskiy Zhurnal" (Journal of Astronomy),

1957, Vol.34, No.2, pp. 310-311 (USSR).

ABSTRACT:

This Conference took place on February 3-4, 1957, at the University of Leningrad. 75 persons took part. V. V. Sobolev gave a review paper on the contemporary

state of the physics of planetary nebulae.

A. Ya. Kipper and V. M. Tiit gave a paper on "Subdivision of light quanta and the relation of this

process to the physics of gaseous nebulae".

G. A. Gurzadyan devoted his paper to the dynamics of planetary nebulae. He noted that the most extended bipolar nebulae should be connected with the magnetic It is possible that bipolar structure is field. connected with the existence of a self-field of the nebula and different velocities of dispersion down and across the magnetic field. Gurzadyan considers that the planetary nebula is a remainder of a primary

material from which the central nucleus-star was formed.

Gradual heating up of the star leads to a gradual expansion of the shell and its final separation.

77.T

Conference on the physics and the origin of plane ary nebulae. (Cont.)

A communication on "Theory of ionisation waves of shells of stars, in connection with the problem of the origin of planetary nebulae" was given by S. B. Pikel'ner S. A. Kaplan (cf. this issue p.183). and I. S. Shklovskiy discussed the nature of the spherical gaseous corona of the Galaxy. The authors criticised Spitzer's theory of the galactic corona. They consider that the motion of the gas is sustained by the waves propagated from the centre of the Galaxy. I. N. Minin noted the great role played by light pressure in the nebula on the order of the HII region. I. S. Shklovskiy gave a brief version of his work on planetary nebulae published in issue No.3, 1956, of the Stronomicheskiy Zhurnal. B. A. Vorontsov-Vel'yaminov noted that in the majority of cases it is impossible to determine whether a given nebula is optically thin or optically thick. It follows that all scales of distances of planetary nebulae are subject to large systematic errors. P. P. Parenago pointed out that a good scale of distances of planetary nebulae does not Recd. TITLE: Shock waves in interstellar space. III. Gasomagnetic discontinuities. (Udarnye volny v mezhzvezdnom prostranstva. III. Gazomagnitnye razryvy).

PERIODICAL: "Astronomicheskiy Zhurnal" (Journal of Astronomy), 1957, Vol.34, No.3, pp.321-327 (U.S.S.R.)

ABSTRACT: It has been established that a magnetic field exists in the interstellar space and has an energy density comparable, with the kinetic energy of the interstellar medium (H24mev). On the other hand, since shock waves and ionisation On the other nama, since shock matter states are often formed in interstellar space, it discontinuities are often formed in interstellar space, it is expected that magnetic discontinuities also occur. theory of shock waves in magnetohydrodynamics has been studied by Hoffmann and Teller (1), Helfer (2), Syrovatskiy (3), Last (6) and the author of this paper (5). With the exception of Kaplan, all these authors assumed that when the gas passes over a magnetic discontinuity the full energy flow is conserved. Kaplan has shown (5-7) that, because of luminescence, this hypothesis is not entirely correct. In the present work, the formation of magnetic discontinuities is considered, taking into account the luminescence and using the method described by Helfer (6) and the author of Card 1/9

33-3-3/32

Shock waves in interstellar space. III. Gasomagnetic discontinuities. (Cont.)

this paper (7). The important and difficult problem of stability of these discontinuities is not at present considered but will be the subject of future communications. For simplicity, only those discontinuities are considered which are limited by plane surfaces. In general, the field vector <u>H</u> and the velocity vector <u>v</u> make angles  $\varphi$  and  $\varphi$  with the front respectively. The motion of the gas is considered in a coordinate system moving with a relative velocity given by:

$$\mathbf{V} = \mathbf{v} - \frac{\mathbf{v} \cos \phi'}{\mathbf{H} \cos \phi} \cdot \mathbf{H}$$

It is assumed that <u>v</u>, <u>H</u> and the normal to the front are coplanar. The general method is as follows. Two control surfaces are taken, one on each side of the front, which are such that the region of rapid change in the parameters occurs between these surfaces. Equations are then set up expressing the conservation of mass transport and impulse over these control surfaces:-

Card 2/9

 $J = \mathbf{e}_1 \mathbf{v}_1 \cos \varphi_1 = \mathbf{e}_2 \mathbf{v}_2 \cos \varphi_2$  (conservation of mass transport)

Shock waves in interstellar space. III. Gasomagnetic

discontinuities. (Cont.)
$$e_1 \left( RT_1 + v_1^2 \cos^2 \varphi_1 + \frac{H_1^2}{8\pi e_1} \sin^2 \varphi_1 \right) = e_2 \left( RT_2 + v_2^2 \cos^2 \varphi_2 + \frac{H_2^2}{8\pi e_2} \sin^2 \varphi_2 \right)$$

(normal component of impulse)  $e_1 \sin \varphi_1 \cos \varphi_1 \left( v_1^2 - \frac{H_1^2}{8 \pi \ell_1} \right) = e_2 \sin \varphi_2 \cos \varphi_2 \left( v_2^2 - \frac{H_2^2}{4 \pi \ell_2} \right)$ (tangential component of impulse)

where  $\mathbf{v}_1$  and  $\mathbf{v}_2$  are the values of the gas velocity before and after the passage of the discontinuity,  $\mathbf{H}_1$  and  $\mathbf{H}_2$  the corresponding magnetic fields, and  $\phi_1$  and  $\phi_2$  the angles between the direction of gas flow, or the magnetic lines of force and the normal.  $\mathbf{T}_1$  and  $\mathbf{T}_2$  are the

temperatures on either side of the discontinuity, the values of which must be prescribed. Furthermore, since Card 3/9 div  $\underline{H}$  = 0, we have

 $H_1 \cos \varphi_1 = H_2 \cos \varphi_2$ 

Shock waves in interstellar space. III. Gasomagnetic discontinuities. (Cont.)

and

$$J^{2} = -Q_{2}Q_{1} \left( \frac{Q_{2}RT_{2} - Q_{1}RT_{1}}{Q_{2} - Q_{1}} + \frac{H_{1}^{2}\cos^{2}\varphi_{1}}{8\pi(Q_{2} - Q_{1})} (tg^{2}\varphi_{2} - tg^{2}\varphi_{1}) \right),$$

$$J^{2} = P_{2}P_{1} \frac{H_{1}^{2}\cos^{2}\varphi_{1}}{4\pi} \frac{tg \varphi_{2} - tg \varphi_{1}}{P_{1}tg \varphi_{2} - P_{2} tg \varphi_{1}}.$$

It is assumed that the gas pressure is much smaller than the magnetic pressure, both before and after the passage of the discontinuity front. Such discontinuities are called magnetic discontinuities. Under these conditions,

$$\frac{J^{2}}{\rho_{1}\rho_{2}} = \frac{H_{1}^{2}\cos^{2}\varphi_{1}}{8\pi(\rho_{2} - \rho_{1})} \left[ tg^{2}\varphi_{2} - tg^{2}\varphi_{1} \right] = \frac{H_{1}^{2}\cos^{2}\varphi_{1}}{4\pi} \frac{tg \varphi_{2} - tg \varphi_{1}}{\rho_{1}tg \varphi_{2} - \rho_{2}tg \varphi_{1}}.$$

Shock waves in interstellar space. III. Gasomagnetic

discontinuities. (Cont.)

provided

$$p_1 \ll \frac{H_1^2}{8\pi}$$
 and  $p_2 \ll \frac{H_2^2}{8\pi}$ 

The last equation has the following three solutions:

$$tg \phi_{2} = \frac{1}{2} \left( \frac{\mathbf{e}_{2}}{\mathbf{e}_{1}} - 1 \right) tg \phi_{1} \pm \sqrt{\frac{1}{4} \left( \frac{\mathbf{e}_{2}}{\mathbf{e}_{1}} + 1 \right)^{2} tg^{2} \phi_{1} + \frac{\mathbf{e}_{2}}{\mathbf{e}_{1}} - 1},$$

$$tg \phi_{2} = tg \phi_{1},$$

The plus sign corresponds to an increasing magnetic field. strong discontinuities and excluding small angles,

card 5/9

tg φ<sub>2</sub> ≈ 
$$\frac{\mathbf{e}_2}{\mathbf{e}_1}$$
 tg φ<sub>1</sub> .

The last equation corresponds to an increasing field. Combining this with  $H_1 \cos \varphi_1 = H_2 \cos \varphi_2$ :

Shock waves in interstellar space. III. Gasomagnetic discontinuities. (Cont.)

$$\frac{H_2}{H_1} \approx \frac{\varrho_2}{\varrho_1} \sin \varphi_1.$$

The other parameters have the following approximate values:

$$v_1^2 = \frac{H_1^2}{8\pi \ell_1} \frac{\ell_2}{\ell_1} tg^2 \varphi_1; \quad c_2^2 = \frac{H_1^2}{8\pi \ell_1} tg^2 \varphi_1.$$

If  $\phi_1 \rightarrow 0$ , these equations do not hold. The solution for small angles is indicated in Fig. 1, but is not derived. Finally, if  $J \rightarrow 0$  (with  $v_1 \rightarrow \infty$ ) then:

$$\frac{\mathbf{e}_2}{\mathbf{e}_1} \longrightarrow \frac{\operatorname{tg} \, \varphi_2}{\operatorname{tg} \, \varphi_1}$$

and

 $v_1 \sin \varphi_1 \rightarrow v_2 \sin \varphi_2$ .

card 6/9

Shock waves in interstellar space. III. Gasomagnetic discontinuities. (Cont.)

If the magnetic field is parallel to the plane of the discontinuity then the transformation:

$$\mathbf{V} = \mathbf{\nabla} - \frac{\mathbf{v} \cos \phi^{\dagger}}{\mathbf{H} \cos \phi} \cdot \mathbf{H}$$

does not apply. This is the "perpendicular wave" case. Here:

J = 
$$\mathbf{Q}_1 \mathbf{v}_1 = \mathbf{Q}_2 \mathbf{v}_2$$
,  $\mathbf{Q}_1 \left( \mathbf{RT}_1 + \mathbf{v}_1^2 + \frac{\mathbf{H}_1^2}{8 \pi \mathbf{Q}_1} \right) = \mathbf{Q}_2 \left( \mathbf{RT} + \mathbf{v}_2^2 + \frac{\mathbf{H}_2^2}{8 \pi \mathbf{Q}_2} \right)$ .

$$v_1H_1 = v_2H_2$$
 or  $\frac{H_1}{e_1} = \frac{H_2}{e_2} = b\sqrt{8\pi}$ ,

Card 7/9

Combining the last two equations:

he last two equations:  

$$\mathbf{e}_1(\mathbf{RT}_1 + \mathbf{v}_1^2 + \mathbf{b}^2\mathbf{e}_1) = \mathbf{e}_2(\mathbf{RT}_2 + \mathbf{v}_2^2 + \mathbf{b}^2\mathbf{e}_2)$$

where b is a constant. Thus, the effect of the magnetic field on the perpendicular gas shock wave can be taken into account by replacing the gas pressure CRT by the effective

33-3-3/32

Shock waves in interstellar space. III. Gasomagnetic discontinuities. (Cont.)

pressure  $e^{RT} + b^2 e_2$ . As was shown in (8), this applies also in a number of other cases. Using formulae (12) given in an earlier paper of the author (6), we obtain:

$$\frac{\mathbf{e}_{2}}{\mathbf{e}_{1}} = \frac{1}{2} \frac{\mathbf{v}_{1}^{2} + \mathbf{RT}_{1}}{\mathbf{RT}_{2} + \mathbf{b}^{2} \mathbf{e}_{1}} \pm \sqrt{\frac{1}{4} \left( \frac{\mathbf{v}_{1}^{2} + \mathbf{RT}_{1}}{\mathbf{RT}_{2} + \mathbf{b}^{2} \mathbf{e}_{1}} \right)^{2} - \frac{\mathbf{v}_{1}^{2} + \mathbf{b}^{2} \mathbf{e}_{1}}{\mathbf{RT}_{2} + \mathbf{b}^{2} \mathbf{e}_{2}}}$$

$$\frac{\mathbf{e}_{2}}{\mathbf{e}_{1}} = \frac{\mathbf{v}^{2}}{\mathbf{RT}_{2} + \mathbf{E}_{1}^{2} / 8 \mathbf{n} \mathbf{e}_{1}},$$

$$\frac{\mathbf{e}_{2}}{\mathbf{e}_{1}} \approx \frac{8 \mathbf{n} \mathbf{e}_{1} \mathbf{v}_{1}^{2}}{\mathbf{n}^{2}}$$

Card 8/9

In the last paragraph, the acutomodel problem is formulated for the isothermal gasomagnetic motion in accordance with

Kak uvidet', uslyshat' i sfotografirovat' iskusstvennyye sputniki zemli. (How to See, Hear and Photograph Artificial Earth Satellites) Moscow, Fizmatgiz, 1958. 78 p. 50,000 copies printed.

Ed.: Leventovskiy, V.I.; Tech. Ed.: Yermakova, Ye.A.

FURPOSE: This popular passiblet is written to explain to the general reader how to observe visually or photographically an artificial satellite.

COVERAGE: The booklet, by giving a few basic formulas, describes in very simple terms the nature of artificial satellites, their relationship to the Earth, and the means of systematic ground-based observation. A list of Soviet permanent stations is appended. There are 26 figures and 4 maps and 9 Soviet references.

· Kaplan, Samil Aronovich

Mezhzvezdneya gazodinemika (Interstellar Gas Dynamics) Moscow, Fiznatgiz, 1958. 194 p. 2,500 copies printed.

Ed.: Samsonenko, L.V.; Tech. Ed.: Gavrilov, S.S.

PURPOSE: This book is intended as a textbook for advanced students of astronomy and practicing astronomers. It may also assist astronomers in mastering the theoretical apparatus of gas dynamics for application to astrophysical problems.

COVERAGE: The book gives a systematic exposition of the basic methods of hydrodynamics, gasdynamics, and magnetohydrodynamics particularly as applied to the study of problems in interstellar gas dynamics. It is primarily concerned with the distribution, motion, and physical state of interstellar gases. It discusses discontinuities of motion, propagation of disturbances, ionization and gasemagnetic effects, interstellar turbulence, and the structure of nebulae. The author expresses his gratitude to S.B. Pikel'ner who reviewed the manuscript and made many valuable comments. There are 38 figures. Of the 99 references, 36 are Soviet, 31 English (3 of which have also appeared in Russian translation), 21 Dutch, 5 German, 4 French, 1 Swedish, and 1 Japanese. Card 1/3

Baum, Fillipp Abramovich, Kaplan, Samuil Aronovich, Stanyukovich, Kirill Petrovich

Vvedeniye v kosmicheskuyu gazodinamiku (Introduction to Space Gas Dynamics) Moscow, Fizmatgiz, 1958. 424 p. 4,000 copies printed.

Ed.: Fridman, V.Ya.; Tech. Ed.: Gavrilov. S.S.

PURPOSE: The purpose of this book is to present to astronomers and physicists the most advanced methods of gas dynamics, to be used for solving various astrophysical and physical problems.

COVERAGE: The book is divided into three parts, each of which is essentially complete within itself. The first part presents the fundamentals of gas dynamics as applied to the motions of cosmic gaseous masses in the absence of magnetic fields. Included in this part are the theory of shock waves and the theory of unsteady motions of a gas, the main emphasis being on the motions of a gas in a gravitational field. The applications of theoretical methods to nonstationary stars and to various geophysical problems are given.

Introduction to Space (Cont.)

SOV/1235

The second part presents the fundamentals of magnetic gas dynamics, which is concerned with the motions of an electrically conducting gas in a magnetic field. This part also considers in detail the statistical theory of turbulence. The theoretical methods are applied to several astrophysical problems. The third part presents the foundations of relativistic gas dynamics and relativistic magnetogasdynamics, both of which deal with dynamic characteristics of gases at velocities near the speed of light. The book is primarily theoretical, and the authors state that much experimental work remains to be done. F.A. Baum wrote chapters II - V of the first part and with K.P. Stanyukovich wrote chapter IX. S.A. Kaplan is the author of the entire second part and also of chapter I of the first part. Stanyukovich wrote chapters VI - VIII and section 12 of the first part, sections 3, 3 a), and 8 a) of the second part, and the entire third part of the book. The authors thank M.A. Leontovich, D.A. Frank-Kamenetskiy, A.M. Yaglom, S.Z. Belen'kiy, S.V. Pikel'ner, and S.I. Syrovatskiy for reviewing various parts of the book in the manuscript and making a number of valuable comments. There are 187 references, 82 of which are Soviet, 87 English, 11 German, 2 Flemish, 2 Swedish, 1 Danish, 1 French, 1 Italian.
